The enzyme inhibitors of the enzyme and methods for detecting such inhibitors are useful for treating conditions involving fibrin, e.g. inflammatory conditions such as all forms of arthritis, organ fibrosis, undesirable scarring, cancer or its metastases; or atherothrombotic disease such as accordary thrombosis, stroke, pulmonary embolism, all other forms of arterial and venous thromboses. This peptide is an internal sequence of the alpha2-antiplasmin cleaving enzyme corresponding to amino acids
                                                                                                                                                                                                                                                                                             invention relates to an alpha2-antiplasmin cleaving enzyme comprising
                                                                                                                                             alpha-2-antiplasmin cleaving enzyme, useful for treating conditions slving fibrin, e.g. inflammatory conditions such all forms of

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (FAR) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition

Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.

```
comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is serile and lacks an adjuvant; a composition of serile and lacks an adjuvant; a composition as the land a control and a control and a control and a control and a control and a control and a control and a control and a composition comprising an amino acid aubstitution of A657D; and a comprising an PAP alpha dimer enzyme lacking amino acids 269-448 and comprising an PAP alpha dimer enzyme lacking amino acids 269-448 and comprising an anti-inflammatory agent, immunosuppressant, or the second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-control anti-inflammatory agent. Immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-control anti-inflammatory agent. The FAP alpha dimer enzyme is a truncation trype FAP alpha dimer enzyme. The FAP alpha dimer enzyme is a fusion or chimmeric procein. The FAP alpha dimer enzyme is a fusion or chimmeric procein. The FAP alpha dimer enzyme is a fusion or chimmeric procein. The FAP alpha dimer enzyme is a heterodimer of a PAP alpha monomer and a DPPIV/CDS monomer. The FAP alpha dimer enzyme comprises an amino acid substitution is present in the beta-propeller domain, the catalytic condition, abnormal immune response is an especially an IL-I mediated condition, abnormal immune response is an elected from inflammation.

Condition, toxic shock syndrome, allergy, asthma, atherosclerosis, condition, and subsequent to an infection, such as an RSV infection. The response is subsequent to an infection, such as an RSV infection. The response is subsequent to an infection, such as an RSV infection. The response is subsequent to an infection, such as an RSV infection. The uncommune disease is selected from continumune disease. Statistance of autoimmune disease is selected from continumune disease. In a subsequent to an infection, such as an RSV infection of the papers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      myasthenia gravis, glomerulonephritis, autoimmue hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of human soluble fibroblast activation protein (FAP) alpha dimer (corresponding to AEB94159 minus N-terminal amino acids 1-37).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a mon-adjuvant second agent; a nation acide 269-48 from mouse FAP.

CC Anti-infective agent such as antibacterial, antitiumgl, antitipated antitipate and anti-inferent agent; immunosuppressant, or anti-infective agent such as antibacterial, antitiungal, antitipated appression or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric protein. The FAP alpha dimer enzyme is a fusion or chimeric contribution relative to wild type FAP alpha dimer. The FAP alpha dimer enzyme is a fusion or chimeric contribution relative to wild type FAP alpha dimer. The FAP alpha dimer enzyme is a fusion or chimeric contribution relative to wild type FAP alpha dimer. The minnon relative to wild type FAP alpha dimer. The minnon condition, or an N-linked glycosylation site and alters disated condition, abnormal immune response is an especially an ILT mediated accordance of subsequent to an infection, such as an RSV infection. The response is selected from cautoimmune d The alpha dimer; guillain barre solvation; processed to the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual content of the annual Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. immune inhibition; fibroblast activation protein alpha dimer; Human soluble (FAP) alpha dimer SEQ ID NO:61. This sequence represents the dimeric fibroblast activation protein alpha (FAP-alpha). The FAP-alpha molecule is capable of degrading extracellular matrix proteins and exhibits structural features typical of type II integral membrane proteins, including a large COOH-terminal extracellular domain, a hydrophobic transmembrane segment and a short cytoplasmic tail.

CG domain, a hydrophobic transmembrane segment and a short cytoplasmic tail. The putative extracellular domain is described as containing five contential N-glycosylation sites, eleven conserved catalytic domains three segments corresponding to highly conserved catalytic domains cancers including breast, lung, skin, pancreas and colorectal carcinomas contain abundant FAP-alpha reactive stronal fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts at times and carcinogenesis is consistent with its putative role in normal fibroblast carcinogenesis la consistent with its putative role in normal fibroblast (S)-valy1-pyrrolidine-Z(R)-boronic acid, may be used to treat various epithelial cancers, e.g. breast, lung, skin, pancreas or colon cancer. Note: This sequence differs from the amino acid sequence of FAP-alpha counting the amino acid sequence of FAP-alpha contains and colon cancer.

The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS034 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient asmple and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Breast cancer diagnosis or treatment by comparing the level of expression of a marker in a patient sample with that in the control non-breast

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a dimeric fibroblast activation protein alpha (FAP-alpha) which is capable of degrading extracellular matrix proteins. The APP-alpha molecule exhibits structural features typical of type II integral membrane proteins, including a large COMH-terminal extracellular domain, a hydrophobic transmembrane segment and a short cytoplasmic tail. Most common types of epithelial cancers including breast, lung, skin, ancreas and colorectal carcinomas contain abundant FAP-alpha reactive stromal fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts at times and sites of tissue remodalling during fetal development, tissue repair and carcinogenesis is consistent with its putative role in normal fibroblast physiology. FAP alpha inhibitors, particularly a collagen derivative or (S)-valy-pyrrolidine-2(R)-boronic carcin, may be used to treat various epithelial cancers, e.g. breast, lung, skin, pancreas or colon cancer. Note: This sequence differs from the carcinome acid sequence of FAP-alpha found in AAW31963 between residues 625

                                                                                                                                                                                                                                                                                                                                                                                                composition comprising an agent that differentially modulates blood or composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation in at correlates with lymphoedema in human subjects, and with the proviso that composition comprising a lymphatic growth agent selected from VEGF-C or VEGF-D polypeptides and polynucleotides. The invention may be useful for the development of compounds with an antiangiogenic, cytostatic, vasotropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary lymphatic producer or in monitoring the efficacy or toxicity of a drug on endothelial cells. In modulating modulation of blood endothelial cells or lymphatic vessel endothelial cell disorder or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cell growth or differentiation. The lymphatic yessel endothelial cell growth or differentiation. The cell or lymphatic vessel endothelial cell growth or differentiation. The lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation. The lymphatic gene or of other diseases and cancer metastasis via the lymphatic expressed protein which is related to the method of the invention. Note: This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                         This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic endothelial cells (LEC) comprises contacting endothelial cells with a

The method of the invention has cytostatic ang applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tumor-associated antigenic target; TAT430; cancer; neoplasm; cytostatic; ovary tumor; uterus tumor.

The present sequence is that of novel tumor-associated antigenic target polypeptide TAT430. TAT polypeptides have been identified ADW14770-ADW14776 whose expression is upregulated in particular tumor tissues. Tissue expression profiling using GeneExpress indicated that TAT430 is upregulated in breast, pancreatic, colon, adrenal, bladder, kidney, liver, lung, lymphoid, ovarian, prostate and stomach tumor stroma as

compared to the corresponding healthy tissues. Upregulation in ovarian tumor tissue was confirmed by quantitative analysis of TAT mRNA expression, and upregulation in breast, pancreatic, colon, adremal and bladder tumors was confirmed by gene expression profiling in silico (GEPIS) analysis. The TAT polypeptide may comprise the full-length polypeptide, or may lack the associated signal peptide, or may comprise an extracellular domain with or without its associated signal peptide, or may be any of these fused to a heterologous polypeptide such as an epitope tag, or the Pc region of an immunoglobulin. TAT polypeptides of the invention, and their encoding nucleic acids, provide targets for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Down-regulating an immune response comprises administering to a subject
in need a fibroblast activation protein (FAP) alpha dimer enzyme in an
amount effective to down-regulate an immune response.
                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    respiratory syncytial virus infection; respiratory-gen.; virucide;

                                                                                                                                                                                                                                                                                                                                                                                              8
```

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (PAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically composition comprising a FAP alpha dimer enzyme in a pharmaceutically composition comprising a FAP alpha dimer enzyme is a maino acid substitution comprising a FAP alpha dimer enzyme lacking amino acids 269-448 fam mouse FAP.

The accondagent is an anti-inflammatory agent, immunosuppressant, or the second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibaccerial, antiviral, antifungal, anti-proceed agents and anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibaccerial, antiviral, antifungal, anti-proceed adminer enzyme is a function or anti-infective agent such as antibaccerial, antiviral, antifungal, anti-proceed adminer enzyme is a function or chimeric procein. The PAP alpha dimer enzyme is a function or anti-infective agent such as antibaccerial, antiviral, antifungal, anti-composition comparises and antipaccerial agent. The amino acid cubstitution relative to wild type FAP alpha dimer. The amino acid cubstitution relative to wild type FAP alpha dimer. The amino acid commation or an N-linked glycosylation site and alters disament or as upperable or condition, abnormal immune response selected from inflammatic forence condition, abnormal immune response selected from inflammatic response is subsequent to an infection, such as an RV infection, cubstitution such as an RV inflammatory condition, and dualian-Barre's syndrome. The abnormal immune cresponse is subsequent to an infection, such as an RV indicated condition, disease, sepsis, graft, versus host barbormal immune expressed is s Disclosure, SEQ ID NO 2, 177pp, English.

RESULT 12

AEB94163;

06-OCT-2005 (first entry)

Mouse wild type fibroblast activation protein (FAP) alpha dimer.

immune inhibition, fibroblast activation protein alpha dimer;
PAP alpha dimer; guillain barre syndrome; antiinflammatory; cns-gen.;
immune disorder; neurological disease; autoimmune disease;
immunosuppressive; graft versus host disease; transplant rejection;
endotoxic shock; osteoarthritis; antiarthritic; osteopathic;
musculoskeletal disease; allergy; antiallergic; asthma; antiasthmatic;
inflammation; respiratory disease; atheroselerosis; antiateriosclerotic;
cardiovascular disease; metabolic disorder; hashimotos disease; antithyroid; endocrine disease; inflammatory bowel disease; antiinflammatory; gastrointestinal-gen.; gastrointestinal disease; rheumatoid arthritis; antirheumatic; multiple sclerosis; neuroprotective; autoimmune hepatitis; antiinflammatory; hepatorropic; systemic lupus erythematosus; dermatological; dermatological disease; uveitis; ophthalmological; autoimmune hemolytic anemia; antianemic;

The mectod further compities an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as antibacterial, antifungal, anti-infective rayme is a truncation when the FAP alpha dimer enzyme is a truncation. The mutant. The FAP alpha dimer enzyme of a repression or chimeric protein. The CC substitution relative to wild type FAP alpha dimer. The amino acid substitution relative to wild type FAP alpha dimer. The amino acid compatin, or an N-linked glycosylation site and alters disulfide bond formation. The immune response is an especially an IL-I mediated condition, abhormal immune response selected from inflammation, cantommune disease, sepsis, agaft versus host disease, transplant rejection, toxic shock syndrome, allergy, asthma, atherosclerosis, catcoimmune disease is selected from or such as an RSV infection. The response is subsequent to an infection, such as an RSV infection. The cutoimmune disease is selected from or such as an RSV infection. The cutoimmune disease is selected from or an englas, cancer or thy infection. The cutoimmune disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, Crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, mysathenia gravis, glomerulonephritis, autoimmune hepatitis and multiple conterosis. The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation proteain (FAR) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme an amino acid substitution of A657D; and a composition comprising a FAP alpha dimer enzyme lacks an amino acid substitution of A657D; and a composition comprising a FAP alpha dimer enzyme lacking amino acids 269-448 and comprising a FAP alpha dimer enzyme lacking the method further comprises administering to the subject a second agent. cancer. The present sequence represents the amino acid sequence of mouse wild type fibroblast activation protein (FAP) alpha dimer. Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. hematological disease; rheumatic fever; antipyretic; Crohns disease; psoriasis; antipsoriatic; graves disease; antithyroid; respiratory syncytial virus infection; respiratory-gen.; virucide; Jesson MI; Disclosure; SEQ ID NO 6; 177pp; English Mclean PA, Jones B, Miller GT, (POIN-) POINT THERAPEUTICS INC. 09-JAN-2004; 2004US-0535577P. 10-JAN-2005; 2005WO-US000709 WPI: 2005-564220/57.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the sequence. The recombination of patent of polymucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one caress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert or polypeput that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori lite cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a Helicobacter pylori cytoplasmic protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes a Helicobacter pylori cytoplasmic protein that may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in B. coli hosts

The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New complexes of protein-protein interactions in Helicobacter pylori, useful for identifying modulating compounds for treating or preventing ulcers in mammals.

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53003 and ACC6610-ACC6194 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of histone deacetylase polypeptides and the genes encoding them. The compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the aberrant expression or activity of the histone deacetylases, such as breast, bladder, colon, lung, rectal, endometrial, overtan and prostate cancer, Paget's disease, melanoma and adenocarcinomas. This sequence represents the histone deacetylase SC_HDAl protein used for sequence comparison with the novel proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytostatic; histone deacetylase; diagnosis; breast; bladder; colon; lung; rectal; endometrial; ovarian; prostate; cancer; Paget's disease; melanoma; adenocarcinoma; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human histone deacetylase polypeptide, useful for and treating disorders with aberrant expression or activity of histone deacetylases, such as breast, colon, lung and prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gottardie M;

                                                                                                                                                                                                                                                                                                         The present sequence is a bait polypeptide used in a Helicobacter pyloritwo-hybrid screen to identify protein protein interactions. The method is used to identify a recombinant cell clone expressing a prey polypeptide which is capable of interacting with the bait polypeptide. The two hybrid system is useful for screening compounds for antibacterial activity. It may be used in the treatment of gastric ulcers. The polynucleotides are useful as amplification primers or specific detection probes. The mono- or polyclonal antibodies. The polynucleotides is immunogens to produce antibodies, vectors, host cells or modulating agents can be used to produce a pharmaceutical composition

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active separt a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament of for the treatment or prevention of a disease or disorder. The sequence

The present sequence is that of an epitope of human thrombospondin-1

(TSP) ADL70639. The epitope is found in TSP and also in a TSP fragment

(TSP) ADL70639. The epitope is found in TSP and also in a TSP fragment

(TSP) Dal Jound in plasma, and their use in clinical assays for

or 20-35 kDa) found in plasma, and their use in clinical assays for

carcer and for generation of antibodies and other binding agents. A

carcer abliding molecule, e.g. an antibody, to obtain anvolves:

(I) using an epitope shared by TSP and the TSP fragment or portion as

target for a binding molecule, e.g. an antibody, to obtain a quantitation

of TSP plus TSP fragment or portion; (2) using an epitope present in TSP

cot TSP plus TSP fragment or portion; (2) using an epitope present in TSP

cot (3) using the difference between (1) and (2) as a quantitation of the

amount of TSP fragment or portion; (2) using an epitope present in TSP

cot (3) using the difference between (1) and (2) as a quantitation of the

amount of TSP fragment or portion; (2) using an epitope present in TSP

cot (3) using the difference between (1) and (2) as a quantitation of the

amount of TSP fragment or portion; (2) using an equalitation of the

cot amount of TSP fragment or portion; (3) using the condition or getted from cancer, renal failure, renal disease,

disease or condition selected from cancer, renal failure, renal disease,

cot dermatchis, myocardial infarction, liver disease, splenectomy,

diabetes mellitus, myocardial infarction, ilver disease, splenectomy,

demacomyositis, rheumatodia arthritis, vasculitis syndrome, Henoch-

The present sequence is that of an epitope of human thrombospondin-1 (TSP) ADL70619. The epitope is found in TSP and also in a TSP fragment present in plasma. The invention relates to TSP fragments (80-110, 40-60 or 20-35 kDa) found in plasma, and their use in clinical assays for cancer and for generation of antibodies and other binding agents. A method that distinguishes TSP from a TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion as a target for a binding molecule, e.g. an antibody, to obtain a quantitation of the but not in the fragment or portion; (2) using an epitope present in TSP but not in the fragment or portion; (2) using an epitope or present in TSP to mount of TSP fragment or portion to obtain a quantitation of the and (3) using the difference between (1) and (2) as a quantitation of the step (1). Detection or quantification of the TSP fragment or portion. The present epitope can be used in step (1). Detection or quantification of the TSP fragment or portion is performed in order to detect the presence, or monitor the course, of a disperse or condition selected from cancer, renal failure, renal disease, atopic dermatitis, vaccultis, actue vascullitis, renal allograft, asthma, condition and the course of the disbetes mellitus, myocardial infarction, liver disease, splenectomy,

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of the procollagen homology domain of human thrombospondin-1 (TSP) ADL70639. It includes the N-terminal portion of the collagen V binding region; the remainder of this region lies in the type 1 repeat domain ADL70644. The invention relates to TSP fragments (80)
Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New purified thrombospondin fragment extracted from a body fluid, usefui
for diagnosing cancer e.g. adenoma, adenocarcinoma, carcinoma, lymphoma
or leukemia or as calibrators, indicators, immunogens and analytes.

the TSP fragment or portion is performed in order to detect the presence, or monitor the course, of a disease or condition selected from cancer, renal failure, renal disease, atopic dermatiis, vascultis, acute vasculitis, renal allograff, asthma, diabetes mellitus, cute cute vasculitis, renal allograff, asthma, diabetes mellitus, myocardial infarction, liver disease, splenectomy, dermatomyositis, myocardial cinfarction, liver disease, splenectomy, dermatomyositis, myocardial condosa, systemic lupus erythematosus, lupus erythematosus, Kawasaki condosa, systemic lupus erythematosus, lupus erythematosus, Kawasaki condosa, non-specific vasculitis, juvenile rheumatoid arthritis, corrematoid arthritis, corrematoid arthritis, associated with clotting, a condition associated with platelet condition associated with platelet corrivation, a condition associated with intravascular platelet corrivation, a condition associated with consumption of platelets, heparin associated with endothelial activation, a condition associated with conduction and/or release of thrombospondin and/or a thrombospondin conduction and/or release of thrombospondin and/or a thrombospondin correction, an aspartame reaction, acondition, a condition, acondition, aconditions aconditions aconditions aconditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
clinical assays for cancer and for generation of antibodies and other binding agents. A method that distinguishes TSP from a TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion as a target for a binding molecule, e.g. an antibody, to obtain a quantitation of TSP plus TSP fragment or portion; (2) using an epitope present in TSP plus TSP fragment or portion; (2) using an epitope present in TSP plus TSP fragment or portion; (2) using an quantitation of TSP only; and (3) using the difference between (1) and (2) as a quantitation of the amount of TSP fragment or portion. Suitable epitopes are provided ADL70602-ADL70638, Detection or quantification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hypersensity vity, scleroderma, conditions associated with hypersensity vity, scleroderma, conditions associated with a cryofibrinogen, a condition associated with a cryofibrinogen, a condition associated with an anticardiolipin antibody. The cancer is selected from adenoma, actinoma, prophoma, leukaemia, solid cancer, liquid cancer, metastatic cancer, pre-metastatic cancer, scancer, increased with vascular invasion, internal cancer, skin cancer of the respiratory system, circulatory system, musculoskeletal system, muscle, bone, a joint, tendon or ligament, digestive system, liver or billiary system, pancreas, head, neck, endocrine system, reproductive system (male or female), genitourinary system, kidney, urinary tract, sensory system, nervous system, lymphoid organ, blood, a gland, mammary gland, prostate gland, endometrial tissue, mesodermal issue,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human myocardial infarction-associated gene derived protein, SEQ ID 1022.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gland, prostate gland, endometrial tissue, mesodermal tissue, ectodermal
tissue, endodermal tissue, a teratoma, a poorly-differentiated cancer, a
well-differentiated cancer or a moderately differentiated cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Myocardial infarction; detection; single nucleotide polymorphism; SNP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual the invention curther comprises: an isolated nucleic acid molecule comprising at least a configuous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an antibody that specification or its complement and encoding any one of the amino comprising an amino acid sequence given in the specification; an antibody that specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid comprising the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid comprising the nucleic acid molecule; a method of detecting a variant polypeptide; and a nucleic acid molecule; a method of detecting a variant polypeptide; and enthod for identifying an agent useful in treating or preventing myocardial infarction may be used in gene therapy. The method is useful in identifying myocardial infarction and for preparing a preparing and presented and an encompanies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              associated gene containing one or more SNP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human myocardial infarction-associated gene derived protein, SEQ ID 1020.
                                                                                                                                                                                                                                                                                                                        Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Myocardial infarction; detection; single nucleotide polymorphism; SNP; cardiant; gene therapy; human.

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleocide polymorphism (SNP) in any one of the nucleocide sequences given in the specification in the individual's altered risk for myocardial infarction in the individual. The individual's conclete acids, where the presence of the SNP is correlated with an correlated risk for myocardial infarction in the individual. The invention further comprises an isolated nucleic acid molecule comprising at least contiguous nucleotides where one of the nucleotides is an SNP given in the specification an its complement and encoding any one of the amino acid sequence given in the specification; an antibody comprising an amino acid sequence given in the specification; an antibody comprising an amino acid sequence given in the specification; an antibody comprising an amino acid sequence given in the specification; an amplified polymucleotide contist an SNP in a nucleic acid molecule, and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and contist and an enzyme; an enthod of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a nucleic acid and infarction. The novel detecting a variant polypeptide; and an enzyme; an enthod of set on gene therapy. The composition for treating or preventing myocardial infarction. This composition for treating or preventing myocardial infarction. This composition is not an enth of a the invention and composition on the protein of a human myocardial infarction. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                associated gene containing one or more SNP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents an angiotenain converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor IC, cellular tumour antigen P53, and vasoactive intestinal colypeptide receptor 2. The polypeptides and their associated nucleic colds are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases when as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidocic pulmonary granulomatous diseases such as as asbestosis and vascular pathologies involving an endothelial
                                   Angiotensin converting enzyme splice variant; ACBV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor IC; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
  Angiotensin converting enzyme (ACEV) splice variant protein #16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

     growth,
                                                                                                                                                  cancer.
This invention describes a novel polypeptide associated with cell growt differentiation and death (CGDD) which has cardiant, cytostatic and neuroprotective activity. The polypeptides of the invention are useful
                                                                               for preparing a composition for disgnosting, or treating a disease or condition associated with decreased expression or overexpression of functional CGDD e.g., cardiovascular or neurological disorders or can The polymuclectides of the invention can be used for gene therapy. ABG74675-ABG74701 represent the human CGDD polypeptides encoded by
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                         ö

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4429. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antiathritic; antidiabetic; antibacterial; antithritic; antidiabetic; antibacterial; antithritic; antidiabetic; antibacterial; antithritic; cardiant; firombolytic; cagulant; neuroprotective; cardiant; firombolytic; cagulant; cootropic; vasotropic; antiporiatic and antianglogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate consists and antagonists may be also be used in drug screens. AAC78449 to AAC7845 and AAB44240 represent sequences used in the exemplification of

The invention describes an isolated mammalian nucleic acid molecule (I) cancoding cancer associated antigen T21, comprising fully defined 2781 cancoding cancer associated antigen T21, comprising fully defined 2781 cancoding cancer associated antigen T21, comprising fully defined 2781 capable (SEQ ID No. 1) or 1605 (SEQ ID No. 2) nucleotic acid molecule (II) capable acid molecule which is at least 90% homologous to a nucleic acid molecule (III) comprising in a normal state; an cancerous tissue compared to that tissue when in a normal state; an cancerous tissue compared to that tissue when in a normal state; an cancerous tissue compared to that tissue when in a normal state; an cancerous tissue compared to that tissue when in a normal state; an cancerous tissue comparising to a sequence of (II), but not (IV) comprising (IV) (II) or (III); a fragment or derivative (VII) or (IVI) but not (IVI); an isolated polypeptide (VI) comprising an amino acid sequence acid residues 39-77 of SEQ ID No. 3; an isolated nucleic acid molecule (VII) or (VIII); a monoclonal antibody (IX) organism (VII); a monoclonal antibody (IX) organism (VII); but not to the protein bound by MAD 3H12; use of an uncleic acid probe (IV), but not to the protein bound by MAD 3H12; use of an uncleic acid probe (IV) which is capable of specifically hybridizing (II), (III) or (VIII); but not to the protein bound by MAD 3H12; use of IV, (III), (III), (III), (VIII) or (VIII), but not to the protein bound by MAD 3H12; use comprising (I), (III), (VIII) or (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), (VIII), ( protective or therapeutic immunity. This is the amino acid sequence of human cancer associated antigen T21.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual determinated soft tissue sample from an individual determining the expression of a gene in both samples and comparing the expression of a gene in both soft tissue samples where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The mucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the
                                                                                                                                                                                                                                                                                     soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

                                                                                                                                                                                                 polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis,
                                               The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of ganulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumnour antigen PS3, and vasoactive intestinal colypeptide receptor 2. The polypeptides and their associated nucleic caids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various can disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as assestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                               Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; destruction; pathogen tolerance; herbicide tolerance; extreme esmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a novel recombinant adenovirus vector mediated anti-neoplastic composition is prepared through cloning the cDNA sequence from the human peripheral blood cell by specific primer and reverse transcription-polymerase chain reaction (RT-PCR) method for coding TSF polypeptide, construction in human embryonic kidney cell 293 by AdRasy system, and packaging and expressing the recombinant adenovirus vector of TSF. It can suppress the growth and transfer of cancer. The present sequence represents the TSF polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor 1C; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complicitis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAB00042
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                                                                                                                                                                                                                                                                        The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at t. E. pseqdata.uspto.gov/sequence.html?DocID:2004014888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme campoints, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing glaactomannan, increased resistance to plant disease, for producing glaactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1c, cellular tumour antigen P53, and vasoactive intestinal colypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, cumune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TSP-1; TSP-2; COMP; cartilage oligomeric matrix protein; thrombospondin; angiogenesis; tumour; treatment; cancer; arthritis; psoriasis; diabetic retinopathy; corneal graft rejection; glaucoma.

New nucleic acids are described which encode a protein comprising the second and third type 1 repeats of human TSP (thrombospondin)-1, but not the TGF (transforming growth factor)-beta activation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage oligomeric matrix protein) assembly sequence (COMP/TSP-1) was produced by PCR (polymerase chain creation). Expression of COMP/TSP-1 caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful for treating angiogenesis related diseases such as cancer (by reducing the rate of growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glaucoma. They may also be used for treating human immunodeficiency virus (HIV) infection. Anti-angiogenic therapy has little toxicity, does not require the therapputic angiogenic therapp has little toxicity, does not require the therapputic tumour growth independently of growth of tumour cell heterogeneity, and cons induce drug resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thrombospondin-1; TSP-1; cytostatic; angiogenesis; vasotropic; vulnerary; neovascularisation; cell proliferation inhibitor; cancer; solid tumour; haemangioma; acoustic neuromas; neurofibroma; trachoma; acoustic neuromas; are neurofibroma; trachoma; pyogenic granulomas; rheumatoid arthritis; ocular angiogenic disease; retinopathy; psoriasis; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rebeosis; angiofibroma; obler-webber syndrome; myocardial angiogenesis; haemophilac joints; plaque neovascularisation; telangiectasia; wound granulation; apoptosis.

The invention describes a composition comprising cDNA encoding fragments of human thrombospondin-1 (TSP -1), a type 1 repeat polypeptide and potent inhibitor of tumour growth and angiogenesis. The composition is useful for killing cancerous cells (preferably tumour); for reducting volume or inhibiting growth of a tumour (inhibiting neovascularisation in the tumour); for decreasing proliferation of tumour cells; in the treatment of diseases and conditions associated with angiogenic activity or misregulated growth and angiogenesis-mediated diseases such as cancer, solid tumour, tumour metastasis, benign tumour, (e.g. heemangioms, neurofibroms, trachoms, and pyogenic granuloms), rheumatoid arthritis, psoriasis, ocular angiogenic diseases (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               698. 325

The carrier chimeric protein comprises the formulae (FI): S1-A-S2-B, where T = S2-B and (F2): T-S1-A-S2-B, where T = Specific alia of action, S1 = spacer and is present or absent; S2 = spacer; A = multimeric action domain of a multimeric protein with a coiled coil domain, e.g., dimeric, trimeric, tetrameric or pentameric protein, or analogous products; and B = protein or amino acid-drug. when S1 is present, S1 and S2 are identical or different: The carrier chimeric protein is useful as therapeutic agent or in gene therapy. The present sequence represents the amino acid sequence in the construction of the carrier chimeric protein
                                                                                                                                                                              New carrier chimeric protein having a multimerization domain and a spacer

                                                                                                                                                                                                                                                                                     ö
                                                                                      The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart diseases, vertoke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is the human variant

The method involves assessing the level of thrombospondin (TSP) protein and/or gene expression in a biological sample. The invention also provides a method useful for assessing the efficacy of a compound or anticoagulant therapy for inhibiting CVD in a patient. CVD include atherosclerosis, coronary artery disease, myocardial infarction (MI), stroke, peripheral vascular disease, congestive heart failure, venous thromboembolism and pulmonary embolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing and monitoring a cardiovascular disease in a patient, by assessing the level of thrombospondin protein and/or gene expression in a

The invention relates to an Erg (a member of the Ets family of transcription factors) modulator for use in medicine, where the modulator is not tumour necrosis factor-alpha (TNF-alpha) or interleukin-1 (IL-1).

Also included are a method of screening for a drug or drug candidate, involving determining whether or not a group being screened modulates the effect of Erg on secreted protein, acidic, cysteine-rich (Osteonectin/BM-C) (SPARC), thrombospondin (TSP), rho-A (a Ras superfamily member) intracellular adhesion molecule-2 (TCAM-2) and/or von Willebrand Factor (vWF) RNA or polypeptide expression, or expression of heterologous RNA or expression of beterologous RNA or expression of Erg or of Erg RNA in a given expression system, determining whether or not a group being screened modulates the cypeation of Erg RNA in a given expression system, determining whether or not a group being screened modulates binding of Erg to a nucleic acid comprising an Erg binding site, determining whether or not a mucleic acid comprising an Erg binding site, determining whether or not a mucleic acid hybridises with DNA of an Erg gene or its transcription product or determining whether or not a mucleic acid knocks out or confect acid comprising whether or not a mucleic acid hybridises with DNA of an Erg gene or its transcription produces expression of Erg Erg based probes can be used in the diagnosis of a disorder such as a disorder in which angiogenesis is involved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammatory disorder, developmental disorder, wound, menstrual disorder involving cell proliferation, a disorder that can be treated by tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      remodeling, cancer, cancer metastasis, rheumatoid arthritis, atherosclerosis, diabetic retinopathy, restenosis, osteoporosis, cataract, diabetes mellitus, glomerulonephritis, inflammatory glomerular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Brg, which is not tumor necrosis factor-alpha or interleukin-1, for treating cancer, rheumatoid arthritis, atherosclerosis, restenosis, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for predicting, diagnosing or prognosing chronic lung disease by detecting a chronic obstructive pulmonary disease (COPD) gene related polynucleocide (see ACC46750 to ACC46777, which encode the COPD related proteins in ABP96779 to ABP96806). The method is useful for predicting, diagnosing or proposing chronic lung disease in a biological sample. The COPD genes and proteins encoded by them from the present invention (I) can be used for treating or preventing chronic lung disease in a mammal. (I) can be used in an animal model for determining the efficacy, toxicity, or side effects of treatment with (I), and determining the mechanism of action of (I). ACC46778 to ACC46091 represent COPD related PCR primers and probes used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Predicting, diagnosing or prognosing chronic lung disease, by detecting a chronic obstructive pulmonary disease (COPD) gene in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chronic obstructive pulmonary disease; COPD; chronic lung disease.
                                      ğ
disease, vasculitis, retinopathy, liver fibrosis, haemoglobinopathy or Crohn's disease. The modulator is useful in the preparation of a medicament for treating a disorder which involves aberrant expression of SPARC, TSP, Tho A, ICAM-2 or WFP. A group that modulates the effect of Brg or a therapeutically active agent is useful for the preparation of medicament for treating the above mentioned disorders. The present sequence is the amino acid sequence of human TSP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kroegel C;

                                                                           The present invention relates to methods and compositions for detecting an anglogenesis-associated transcript in a cell in a patient. The method involves contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence at least 80% identical to any of the angiogenesis-associated human polynucleotide sequences given in the specification. These angiogenesis-associated polynucleotide sequences comprise genes that exhibit changes in expression levels as a function of time in tissue undergoing carponesis. The method and the polynucleotide sequences of the invention are useful for diagnosing and treating angiogenesis and angiogenesis-associated diseases e.g. cancer. The polynucleotide sequences are also useful in the gene therapy of such disorders. The sequences are also useful in the gene therapy of such disorders. The sequences are also useful to the gene therapy of such disorders. The sequences are useful as a vaccine for therapeutic and prophylactic immunisation. ABU03456-ABU03569 represent anglogenesis-associated protein sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting angiogenesis-associated transcript in a cell for diagnosing and treating cancer by contacting a sample with a polynucleotide that exhibits changes in expression level as a function of time in tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 42; DB 6; Length 1170;

                                                                               RESULT 49
```

```
This invention describes a novel method for identifying a subject as a candidate for a particular course of therapy to treat a vascular disease or disorder. The method comprises determining the identity of the nucleotide present at specific positions, or their complements, and identifying the subject as a candidate for a particular clinical course of therapy based on the identity of the nucleotide present in that specific position. The method can be used for identifying a subject who is a candidate for further diagnostic evaluation of a vascular disease or disorder and selecting a clinical course of therapy. The products of the invention have cardiant, antiateriosclerotic and cerebroprotective cinvention have cardiant, antiateriosclerotic and cerebroprotective activity and can be used for gene therapy. The methods disclosed are activity and can be used for gene therapy. The methods disclosed are cartery disease, myocardial infarction, ischaemia, stroke, peripheral coursel in a fingerprint for detecting different individuals watchin the same species applicable in forensic studies and paternity cesting. This sequence represents the human THBSI gene represented in course invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a subject as a candidate for a particular course of therapy to treat a vascular disease or disorder, e.g. stroke, myocardial infarction or ischemia by determining the identity of the nucleotide

```
New nucleic acid molecule comprising first nucleic acid sequence encoding at least one CD36 binding domain, and a second nucleic acid sequence encoding at least one immunogenic amino acid sequence, useful for eliciting immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid molecule encoding an immunogenic chimeric polypeptide. The isolated nucleic acid molecule comprises at least a first nucleic acid sequence encoding at least one immunogenic amino acid sequence, where the introduction of the nucleic acid molecule in a cell results in expression of the immunogenic chimeric polypeptide. The nucleic acid molecule is useful for eliciting an immune response. The present sequence represents a human thrombospondin 1 (TSP1) polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; differential expression; cancer; angiogenic disorder; fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease; retinal neovascularistaion syndrome; scarring; uterine fibroid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cancer/angiogenesis/fibrosis-related polypeptide, SEQ ID NO:C222

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention is based at least in part on the discovery of polymorphisms within the thrombospondin 1 (THBS1) or THBS4 genes. The invention also provides a nucleic acid comprising allelic variant of polymorphic region of THBS1 or THBS4 gene. The method is useful for identifying a subject as a candidate for a particular clinical course of therapy or to treat a vascular disease or disorder and for selecting a clinical course of therapy to treat a subject who is at risk for developing a vascular disease or disorder. The present sequence is human THBS1 reference protein. Note: This sequence is said to be encoded by SEQ ID NO: 1 (AADS5693). However this does not appear to be the case
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated nucleic acid comprising allelic variant of polymorphic region of thrombospondin 1 or 4 gene, useful for identifying predisposition of subject to develop vascular disease associated with the allelic variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibratic disorders, and to methods of determining the presence or absence of a pathological cell in a conferenting the presence or absence of a pathological cell in a conferenting the presence or absence of a pathological cell in a conferenting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The conclet acid of the invention, antibodies which specifically bind a conclet acid of the invention, use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, attentable acids inflammatory diseases, autonimune diseases, ratinal neovascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
detection; diagnosis; prognosis; drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glynne R, Hevezi PA;

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy cubicity pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial colls are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels discrease when respiratory epithelial colls are stimulated with interleukin-13. Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (c) asthma or chronic obstructive pulmonary disease; (b) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, (c) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, (c) a marker gene, a ribozyme, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising conchial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present cy sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a

mol.wt.) found in plasma, and their use in clinical assays for cancer and for generation of antibodies and other binding agents. A method that distinguishes TSP from a TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion of TSP plus TSP plus TSP fragment or portion; (2) using an antibody, to obtain a quantitation of TSP plus TSP fragment or portion; (2) using the difference between (1) and (2) as a quantitation of the amount of TSP fragment or portion. Suitable epitopes are provided ADL70602-

CC using the difference between (1) and (2) as a quantitation of the amount of TSP fragment or portion is performed in order to detect the presence, or monitor the course, of a close or condition selected from cancer, renal failure, renal disease, of a close or ordition selected from cancer, renal failure, renal disease, close architels, vasculitis, acute vasculitis, renal allograft, asthma, close architels, rename to the TSP fragment or portion is performed in order to detect the presence, or monitor the course, of a close acutivitis, vasculitis, vasculitis, juvenile returnatomyositis, polyarteritis nodosa, systemic lupus erythematoctay. CC dermatomyositis, polyarteritis nodosa, systemic lupus erythematocty condition, a condition associated with intravascular condition, a condition associated with nother activation, a condition associated with products on and/or release of thrombospondin and/or a thrombospondin or condition, intravascular coagulation, extravascular coagulation, intravascular coagulation, a condition associated with a cryoglobulin, and condition associated with a cryoglobulin, and condition associated with a cryoglobulin, and condition associated with a cryoglobulin, and a condition associated with a cryoglobulin, and a condition associated with a cryoglobulin, and a condition associated with a cryoglobulin, and a condition associated with a cryoglobulin, and endocarround and and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     angiogenesis; cytostatic; cancer; gene therapy; human; thrombospondin 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                modulates angiogenesis which comprises contacting the compound with a nucleic acid, or a polypeptide encoded by a nucleic acid, that hybridises uncleic acid, or a polypeptide encoded by a nucleic acid, that hybridises functional effect of the compound upon the nucleic acid and determining the method of the invention has cytostatic applications and may be useful for identifying a compound that modulates angiogenesis for treating cancer or for use during gene therapy procedures. The current sequence is that of an anglogenesis-related human protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for identifying a compound that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a compound that modulates angiogenesis for treating e.g., cancer comprises contacting the compound with a nucleic acid or polypeptide and determining the functional effect of the compound upon the nucleic acid or polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This sequence represents thrombospondin 1 encoded by the TH881 gene. This protein supregulated in BCEC (brain capillary endochelial cells) by protein sequence may be used in the enclod of the invention for modulating the permeability of the invention for modulating the permeability of the invention for modulating the permeability of the invention for modulating the permeability of the invention for modulating the permeability of the invention for modulating the permeability of the activity or the steady-state level of a pro-barrier (PB) polypeptide amino acid sequence elected from ADO26047AD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02605AAD02606AAD02605AAD02606AAD02605AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02606AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02609AAD02600AAD02600AAD02600AAD02600AAD02600AAD02600AAD
                                                                                                                                                                                                                                                                                                                           Modulating the permeability of endothelial cells, useful for treating or preventing e.g. neurodegenerative disorders, comprises altering in the endothelial cells the activity or the steady-state level of a pro-barrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reperfusion injury, angina, myocardial infarctions, chronic heart conditions, or osteoporosis). The PB polypeptide may also be used in the manufacture of a composition for reversibly increasing the microvascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 42; DB 8; Length 1170;

The present invention describes an isolated PRO nucleic acid (1). Also described: (1) a vector comprising (1); (2) a host cell comprising the vector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the composition of matter comprising a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a comprising a container, a label on the container and a composition of matter of (1); (9) a method of treating an immune related disease in a command; (10) a method for determining the presence of a PRO polypeptide in a sample suspected of having the polypeptide; (11) a method of disease or an inflammatory immune response in mammal; (12) a method of identifying a compound that inhibits or minics the activity of or expression of a gene encoding a PRO polypeptide; and (13) a method of simulating the immune response in a mammal. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New PRO polynucleotides and polypeptides, useful in useful in diagnosing and treating an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, diabetes mellitus or asthma and in stimulating an immune response.
                                                                                                                                                                                                                                              haemostatic; hepatotropic; immunostimulant; immunosuppressive; muscular; nephrotropic; neuroprotective; osteopathic; respiratory; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PRO sequences have antiallering antianaemic, antiarthritic, antiasthmatic, antidiabetic, antiantantory, antipsoriatic, antiathmatic, antityroid, CNS, dermatological, gastrointestinal, haemostatic, hepatotropic, immunostimulant, immunosuppressive, muscular, nephrotropic, neuroprotective, osteopathic, respiratory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid (1) and the encoded polypeptides, compositions, kits and methods are

                                          ADP54179;
```

useful in diagnosing and treating an immune related disease and in stimulating an immune response. The present sequence represents a human PRO protein from the present invention.

Sequence 1170 AA;

Life inversion creates to a novel method for the comprises detecting a single nucleotide polymorphism (SNP) in any one of comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification; in the individual's nucleotide acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention altered risk for myocardial infarction in the individual. The invention cates comprises; an isolated nucleic acid molecule comprising at least of contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification, an amino acid sequence given in the specification, an amino acid sequence given in the specification, an amino acid sequence given in the specification and which is between about 16 and 1000 nucleotides in specification and which is between about 16 and 1000 nucleotides in conprising the conclete acid molecule; a method of detecting a variant polypeptide; and a nucleic acid molecule; a method of detecting a variant polypeptide; and a myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or method is useful and an increased or method is useful and an increased or method is useful and an increased or method is useful and an increased or method is useful and an increased or method is useful and an increase and an increase and an increased or method is useful and an increase and an increase and composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarctionassociated gene containing one or more SNP's of the invention. Note: This Human myocardial infarction-associated gene derived protein, SEQ ID 1021. the invention relates to a novel method for identifying an individual who Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids. Myocardial infarction; detection; single nucleotide polymorphism; SNP; decreased risk for developing myocardial infarction and for preparing composition for treating or preventing myocardial infarction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nuclectide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual's cureled risk for myocardial infarction in the individual. The invention altered risk for myocardial infarction in the individual. The invention correlates an isolated nucleic acid molecule comprising at least so contiguous nucleotides where one of the nucleotides is an SNP given in the specification any one of the amino comprising an amino acid sequence given in the specification; an antibody that specification and which is between about 16 and 1000 nucleotides in specification and which is between about 16 and 1000 nucleotides in specification and which is between about 16 and 1000 nucleotides in specification and which is between about 16 and 1000 nucleotides in clength; a kit for detecting an SNP in a nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting an agent useful in treating or preventing method for identifying an agent useful in treating or preventing method has cardiant activity.
                                                                                                 ö
                                                                                                                                                                                                                                                                                                    Human myocardial infarction-associated gene derived protein, SEQ ID 1019
sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.

```

```
The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleotide acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention altered risk for myocardial infarction in the individual. The invention curter comprises: an isolated nucleic acid molecule comprising at least sometiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an amplified polynucleotide or its antigen-binding the fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                  decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction-associated gene containing one or more SNP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Myocardial infarction; detection; single nucleotide polymorphism; SNP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
is useful in identifying an individual who has an increased

polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and. a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a sequence represents the protein of a human myocardial infarction. This sequence was not shown in the specification. The sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the MIPO website.

Assessing whether a patient is afflicted with rheumatoid arthritis comprises determining the level of expression of one or more markers in patient sample.

Disclosure; SEQ ID NO 44; 182pp; English.

The invention is directed to methods of determining or diagnosing whether patients are inflicted with inflammatory disorders, e.g. joint disorders, especially rheumatoid arthritis (RA). These methods involve obtaining a sample of a patient's body fluid, e.g. blood serum, determining the level of expression of one or more markers in the fluid, and identifying whether the patient's body fluid has a pattern or profile of expression of a selected marker of marker set which correlates with the presence of the inflammatory disorder. The invention also provides methods for determining or diagnosing whether patients are afflicted with a particular form of arthritis, such as erosive RA. The markers whose expression correlates with the presence or absence of RA were identified by the sequencing of peptides derived from proteins in the sera of healthy, non-erosive and erosive patients by mass spectroscopy. Markers

The present invention provides a method for analyzing differential protein expression associated with histopathological features of breast protein expression associated with histopathological features of breast disease, in particular breast tumors, e.g. breast carcinomas, comprising detecting the overexpression or underexpression of a pool of proteins in breast tissues or cells. The pool comprises all or part of a protein set comprising: afadin, aurora A, alpha-catenin, beta-catenin, BCL2, cyclin CC D1, cyclin E, cytokeratin 5/6, cytokeratin 8/18, E-cadherin, BCR2, cyclin CC D1, cyclin E, cytokeratin 5/6, cytokeratin 18/18, angl, aurora B, BCRP1, FTHT, GATA3, Ki67, mucin 1, p53, CC Cytokeratin 18, angl, aurora B, BCRP1, cathepain D, CD10, CD44, CK14, CC Cytokeratin 18, angl, aurora B, BCRP1, cathepain D, CD10, CD44, CK14, CC Cox2, fibroblast growth factor 2 (FGF2), GATA4, hifla, matrix CC Cox2, fibroblast growth factor 2 (FGF2), GATA4, hifla, matrix CC Cox2, fibroblast growth factor 2 (FGF2), GATA4, hifla, matrix CC Cox2, fibroblast growth factor 2 (FGF2), GATA4, hifla, matrix CC CC CX2, fibroblast Growth SCRIBBLE, smooth muscle actin, CC CC Thrombospondin (THBS) 1, tissue-inhibitors of matrix metalloprotease (WMP) 2 (TIMP1). The measuring of over- or underexpression of proteins is carried cout on tissue microarray, by immunohistochemistry (IHC) technologies. The method may involve comparing expression levels of the protein set in a

cultion many also involve detecting the over- or underexpression of nucleic acids coding for the proteins. Also claimed are a protein library and a mucleic acid library useful for the molecular characterization of histopathological features of breast disease. The method is useful for analyzing differential protein expression associated with useful for histopathological features of breast disease. It is also is useful for carecting, diagnosing, staging, monitoring, predicting, and preventing conditions associated with breast cancer, predicting clinical outcome of breast cancer, predicting occurrence of metastatic relapse, and for a patient can be based on the analysis of the differential protein carperssion profile. Breast cancers can be classified into prognostically relevant subclasses, and appropriate doses and/or schedule of chemotherapeutics and/or biopharmaceuticals and/or radiation therapy can be elected to circumvent toxicities in a patient. The method is also useful in assessing breast cancer heterogeneity and prognosis in patients the present sequence is that of
control sample to levels of equivalent proteins in a tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      thrombospondin 1 (THBS1).

Disclosure; SEQ ID NO 28; 377pp; English

The invention relates to a composition comprising a gastrointestinal proliferative factor (GIPF) polypeptide, itse fragment or analogue, and a proliferative factor (GIPF) polypeptide (comprising a biologyteally active fragment of GIPF and a caritar, also included are applacably active fragment of GIPF and a caritar, a method of stimulating optihalial cell proliferation, a method of treating a disease (chosen from mucositis, inflammatory bowel (sease or short bowel syndrome, comprising administering to the composition), a method of treating a disease or short bowel syndrome, comprising administering to the composition, a method for treating a patient at mammalian subject the composition), a method for treating a patient that has undergone radiation therapy/chemotherapy by administering the composition, a method for treating a patient that has undergone radiation therapy/chemotherapy by administering the composition, a method for treating a patient that has undergone radiation therapy/chemotherapy by administering the composition, a method for construct comprising associated with an expression control sequence) construct comprising associated with an expression control sequence.

CC foretruct comprising numbered with an expression control sequence of size expression in B-cells), a transgenic mouse that produces in the Eaguence encoding GIPF protein, operably linked to transcriptional regulatory sequences directing its expression vector comprising expression regulatory sequences directing its expression vector comprising expression regulatory sequences directing its expression vector comprising expression regulatory collogorated virth the polympetide perpendence directing its expression vector comprising expression regulatory collogorated with the polymucleotide, an expression vector comprising expression regulatory collogoration and a polypeptide perpendence directing its expression of the polympetide methods of producing a patient the polympetide perpendence with the polympetide perpendence of SEC ID No. 4, wher administering the composition. The present sequence represents a human protein showing some sequence similarity to GIPF.
